Setup for NFS shares

Install packages for server

Install the required packages:

```
apt-get install nfs-kernel-server nfs-common portmap
```

Create the folder to share

```
mkdir /home/nfs
```

No need to change the permissions

Config shares

```
nano /etc/exports
```

```
/home/nfs      192.168.20.160(rw,no_root_squash,sync,no_subtree_check)      #
for a remote machine
/home/nfs      192.168.20.150(rw,no_root_squash,sync,no_subtree_check)      #
for the localhost itself
```

```
/etc/init.d/nfs-kernel-server reload
```

and

```
 service nfs-kernel-server status / stop / start
```

to control and check the server NFS.

> ⚠️ be carefull about the IPS's when eth0 and vmbr0 are **not properly** reconfigured: for the remote hosts the IP of the vmbr0 is required, for the localhost the IP of eth0 is needed into /etc/exports!
> "service nfs-kernel-server status" can show which machine is trying to connect.

> 💡 No need to modify any parameters of the firewall!
